NSDQ ETF COIN

The world's first security token representing the NASDAQ

NSDQ ETF COIN (NSDQ) aims to create an ecosystem where investing in a major stock index is as easy as buying a crypto token on your phone. We offer the growth potential of NASDAQ stocks to a broad audience, all through a secure token that provides real asset ownership, continuous liquidity and compliance. Additionally, we are introducing the advantages of cryptocurrency to the traditional financial world - such as the broader accessibility and lower entry barriers, as well as 24/7 trading and favorable taxation conditions.

The ecosystem

The NSDQ token

The NSDQ token is the centerpiece of the ecosystem – a digital security token that represents an investor's stake in the NASDAQ ETF portfolio. Because the token qualifies as a security token, it confers an investment claim on real assets (unlike utility tokens). Every NSDQ token is backed by a fraction of the NASDAQ ETF holdings managed by the project.

Frontend / User Interface

The user interface is the accessible front-end through which investors interact with the entire system. It includes a modern app and web dashboard where users can register, complete KYC, deposit funds, and manage their NSDQ token holdings. The frontend is designed for simplicity, making the experience akin to using a regular fintech or trading app.

Investment Backend

The investment backend refers to the off-chain engine that takes investor funds and converts them into actual ETF investments. It is essentially the bridge between the blockchain and the traditional stock market. It handles price feeds, trade execution, allocation of ETF shares to the project's portfolio corresponding to each token issuance and guarantees NSDQ tokens are always backed.

Custody and Fund

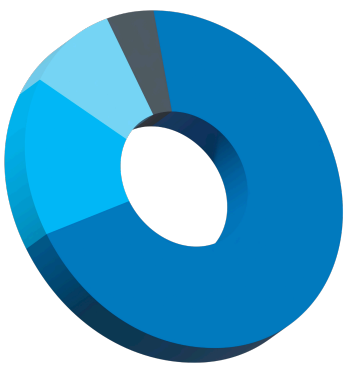

We partner with a licensed custodian to hold the NASDAQ ETF assets on behalf of token holders. This means that for every NSDQ token in circulation, the equivalent value in ETF shares is kept in a segregated custodial account. The custodian's role is to ensure the assets backing the tokens are safe (protected against loss, theft, or misuse) and to facilitate any necessary transactions.
